

WHAT VEKTOR IS NOT.

An honest description of scope, limitation, and design intent. We believe you should know what this platform does not do before we tell you what it does.

This document exists because we spent years wishing someone would write it.

The questions these pages do not answer — ask us. We will tell you.

WHAT VEKTOR IS NOT

NOT A BLACK BOX

Every allocation, every signal selection, every portfolio configuration is fully explainable. You can see the model, interrogate the output, and override any recommendation. Nothing moves capital without a human decision at the gate.

NOT A REPLACEMENT FOR INVESTMENT JUDGMENT

Vektor optimises within the parameters you set. It does not set them. The investment universe, benchmark, base currency, risk constraints, and mandate objectives remain yours. Vektor executes them with rigour — it does not substitute for the judgment that defined them.

NOT AN AI TRADING SYSTEM

Vektor uses statistical optimisation across 10,000 portfolio configurations to identify the max-Sharpe allocation. It does not use ML to predict market direction or learn from your portfolio. The distinction between optimisation and prediction matters and we will not blur it. See: WP-08 — AI and Machine Learning: Our Philosophy

NOT LIVE-TRADING IN CLIENT ACCOUNTS YET

IBKR integration infrastructure has been built and validated through paper trading. Orders are prepared, queued, ML-validated, reviewed, and approved — and tested end-to-end. Live client execution (real-money order submission) is the next development milestone. We will tell you when it is active.

NOT A MULTI-ASSET PLATFORM YET

Listed equities across any exchange and currency. Fixed income, alternatives, real assets, derivatives, and multi-asset portfolios are not yet supported. The SAA roadmap describes when and how these capabilities will be built.

NOT A FIRM WITH A LIVE TRACK RECORD

Vektor has not yet managed live client capital. The Proof Partners programme is the mechanism through which the first live track record will be established. We have backtested methodology, validated signal selection, and a robust paper-trading environment. We do not present these as a substitute for live performance history.

Vektor is portfolio management infrastructure — a systematic tool used by regulated investment professionals. It is not a regulated product in its own right. The regulatory status of the platform and its use varies by jurisdiction. We will tell you exactly what applies to yours before any commercial engagement.

NOT SUITABLE FOR EVERY MANDATE TYPE

Listed equity mandates across any exchange and currency. Not fixed income. Not alternatives. Not derivatives. Not leverage strategies. If your mandate structure requires capabilities outside this scope, we will tell you before we proceed further.

NOT A GUARANTEE OF ANY OUTCOME

99.94% capital allocation efficiency is an operational metric describing how precisely available capital is deployed at live prices. It is not a performance claim. Signal selection is calibrated to historical price data, which does not guarantee future results. Market regime changes affect systematic approaches. We have written a white paper about what can go wrong. We recommend reading it.

See: WP-09 — Risk Disclosure

WHAT VEKTOR IS

Having been precise about what Vektor is not, here is what it is. With the same precision.

Systematic listed equity portfolio management.

Any exchange. Any currency. Any benchmark. The engine runs identically across Singapore equities, London-listed industrials, or any market with sufficient historical price data. Configuration is the only variable.

Multi-mandate from day one.

Different clients run on different mandates concurrently — separate universes, separate benchmarks, separate currencies, independent of each other. There is no limit on the number of concurrent mandates.

Institutional rigour at boutique scale.

10,000 portfolio configurations map the efficient frontier. Max-Sharpe allocation via PyPortfolioOpt. Per-instrument signal selection across six indicators with XGBoost validation. 99.94% capital allocation efficiency at live prices. The methodology is fully documented across ten research papers.

See: WP-01 through WP-10 — The Vektor Research Series

Human-gated at every capital-at-risk stage.

The platform prepares. A qualified human approves. Every order, every rebalance, every execution is reviewed before capital moves. Automation handles the analysis. People handle the decisions.

Fully explainable and auditable.

Every allocation decision is traceable to the signal selection and optimisation that produced it. Every trade has an audit trail. Nothing is a black box and nothing is irreversible without a record.

See: WP-06 — Audit, Compliance, and Operational Architecture

Available to demonstrate on your data before any commitment.

Pick any listed equity market, any currency, any benchmark. We will run the full Vektor workflow and show you the output: the efficient frontier, the correlation matrix, the max-Sharpe allocation, and the per-instrument signal selection. No slides. No promises. Just the platform, working on your data.

Show us a mandate. We'll show you the platform.
