WORKFLOW INTEGRATION GUIDE

Workflow Integration Guide

What it replaces, what it augments, and what stays exactly as it is.

For DPMs and portfolio managers evaluating Vektor alongside existing infrastructure

IP-WIG-260501-1.0

May 2026

This document addresses the question that every DPM asks but rarely states directly: 'What does this mean for the way I work today?' It maps the typical DPM workflow against the Vektor platform — task by task — and states honestly what Vektor replaces, augments, and leaves unchanged.

1

THE WORKFLOW MAP

What the typical DPM does today — and where Vektor sits in that workflow.

DPM TASK TODAY	VEKTOR'S ROLE	WHAT CHANGES
Screen a universe of 500+ stocks manually or via Bloomberg screens	Replaces	Vektor runs the screening systematically against configured liquidity, sector, and dividend criteria. Output: a ranked, filtered universe ready for portfolio optimisation.
Select portfolio instruments based on research and intuition	Augments	The screened universe is the input — the analyst reviews it and selects the final instruments. Vektor accelerates the screening; the selection remains human.
Build a portfolio allocation using Excel or a Bloomberg model	Replaces	10,000 portfolio configurations map the efficient frontier; Modern Portfolio Theory identifies the max-Sharpe allocation. Output: a complete weight set with efficient frontier chart and correlation matrix.
Select technical indicators and set parameters manually	Replaces	Grid search across six indicators per instrument, optimised for Sharpe ratio over a three-year window. XGBoost validated per instrument.
Review and approve the portfolio strategy	Unchanged	The portfolio manager reviews the complete strategy — all instruments, weights, indicators, and Sharpe ratios — and approves. This step is structurally required. It is not faster or slower; it is better-informed.
Convert portfolio weights to share quantities	Replaces	Allocation calculation at live prices, with lot-size rounding and cash buffer. Output: exact share quantities per instrument.
Submit orders to the broker	Replaces (when live)	Orders submitted via SQS queue to IBKR Gateway. Currently in simulation mode — live execution before first Proof Partner onboards.
Record cash movements and reconcile	Augments	Cash funding recorded in the platform with currency, amount, and reference. Reconciliation against custody records remains with Operations.
Produce audit trail and compliance documentation	Replaces	Every action logged with timestamp and user identity as a by-product of normal platform operation. No separate documentation required.

Report to clients on portfolio performance

Not yet in scope

Client reporting is on the product roadmap. Performance data available via API and Admin Portal. Formatted client reports are a near-term roadmap item.

2

VEKTOR ALONGSIDE BLOOMBERG

The most common existing infrastructure question — how does Vektor relate to a Bloomberg terminal workflow?

Bloomberg is not one product. It is three distinct products, each with a different relationship to Vektor: the Bloomberg Terminal, Bloomberg PORT, and Bloomberg data feeds. Understanding the distinction determines which Vektor entry motion applies.

BLOOMBERG TERMINAL — STAYS

The Bloomberg Terminal (\$31,980/seat/year in 2026; approximately S\$43,000+ SGD) provides price discovery, news, IB Chat messaging, fixed income coverage, and corporate action monitoring. Vektor does not compete with the Terminal and does not replace it. Terminal clients keep their Terminal. All of the above continues unchanged.

BLOOMBERG PORT — DIRECT REPLACEMENT

Bloomberg PORT is the portfolio construction and analytics module — a separate subscription layered on top of the Terminal, typically adding S\$8,000–S\$25,000 per seat per year. PORT is what Vektor replaces, specifically, for listed equity portfolio construction. A client who cancels PORT and buys Vektor: pays less, retains the Terminal for everything it does well, and gains systematic construction capability that PORT does not provide in the same accessible form. The ROI is immediate and calculable.

BLOOMBERG DATA FEEDS — DEVELOPMENT TERMINATION

Bloomberg data feeds (B-PIPE and equivalent) are enterprise data agreements used by quantitative teams consuming market data programmatically for in-house systematic development. Firms running Bloomberg data feeds to build what Vektor already is are engaged in a build-or-buy decision. Vektor terminates that decision in favour of buy — immediately, at lower cost, and with better systematic construction capability than most in-house builds achieve.

WHAT VEKTOR DOES INSTEAD OF BLOOMBERG (ALL CONFIGURATIONS)

Universe screening (replacing Bloomberg screen-based filtering). Portfolio optimisation (replacing BOPT or Excel-based optimisation). Technical indicator selection and optimisation. Allocation calculation (replacing Excel-based weight-to-quantity conversion).

DATA SOURCE

Vektor uses Yahoo Finance for historical price data as standard. A DPM requiring Bloomberg-quality data can substitute a Bloomberg data feed as the market data source — this is a configuration change, not an architectural change, and is available as a Proof Partner engagement option. Note: this is a data feed

substitution only. It does not require or imply a Bloomberg Terminal subscription.

3

VEKTOR ALONGSIDE AN EXISTING PMS

For DPMS with an existing Portfolio Management System — how Vektor connects as the quantitative construction layer.

Vektor is designed to operate as a complement to an existing PMS. The platform produces a trade-ready allocation table — instruments, target quantities, target values — via REST API. An existing PMS integration receives this table and processes it through the existing order management and reconciliation workflow.

WHAT THE API DELIVERS

A JSON response containing: instrument identifier (ticker + exchange), target quantity (lot-rounded), target value (at calculation price), portfolio weight, and assigned technical indicator. Complete information to raise orders in any order management system.

INTEGRATION EFFORT

A standard REST API integration between Vektor's allocation endpoint and an existing PMS typically takes two to four weeks for a developer familiar with the target PMS. Vektor provides API documentation and integration support as part of Proof Partners programme onboarding.

WHAT THE PMS CONTINUES TO HANDLE

Order management workflow. Client account reconciliation. Custody interface. Compliance pre-trade screening. Client reporting. All of this continues through the existing PMS — Vektor is upstream.

4

THE DPM WITHOUT A PMS

For boutique DPMs and family offices managing portfolios in Excel — what the transition looks like.

Many boutique DPMs and independent family offices manage client portfolios in Excel, with Bloomberg or Yahoo Finance as the data source and manual order entry at the broker. This is the workflow Vektor is most directly designed to upgrade.

WHAT VEKTOR REPLACES IN THIS WORKFLOW

The universe screening spreadsheet. The optimisation model. The indicator selection process. The weight-to-quantity calculation. The order list preparation. The audit trail — if one exists at all.

THE HONEST TRANSITION REALITY

Moving from an Excel-based workflow to a systematic platform takes time and requires a period of parallel running. The portfolio manager's judgement does not become redundant — it becomes better-supported. The Founding Partner engagement structure is designed to support this transition: Vektor is configured around the specific instruments, markets, and client profiles of the founding firm, not the other way around.

WHAT THE DPM GAINS

A systematic, replicable process that produces the same quality of output regardless of time pressure or individual analyst capacity. An audit trail that documents every decision. The ability to manage more client mandates with the same team.

5

WHAT VEKTOR DOES NOT REPLACE

Important to state clearly.

The portfolio manager's judgement

Vektor produces a systematically optimised strategy recommendation. The portfolio manager reviews it, challenges it, and approves or modifies it. The PM's understanding of the client, market context, and risk environment is the final filter the platform is designed to support — not replace.

Client relationships

Vektor manages portfolios. It does not manage clients. The relationship between the DPM and the client — suitability assessment, regular reviews, reporting, communication — remains entirely with the portfolio manager.

Regulatory compliance

Vektor provides the audit trail that supports compliance. Regulatory obligations — licensing, suitability, reporting — remain with the operating firm. Vektor is a tool in a regulated firm's hands, not a substitute for that firm's regulatory standing.

Fixed income, alternatives, and structured products

Vektor is a listed equity platform. A multi-asset DPM continues to use existing tools for non-equity asset classes. Vektor handles the listed equity sleeve.

For the technical integration architecture, see WP-07. For the platform workflow in detail, see the Platform Brochure. For risk and limitation disclosure, see WP-09. All documents at investpuppy.com.

Show us a mandate. We'll show you the platform.

Pick any listed equity market, any currency, any benchmark. We will run the full Vektor workflow on your data and show you the output. No slides. No promises.
