

FOUNDER CONTEXT

The experience behind the platform.

"Honest by design."

Document:	IP-FOUNDER-CONTEXT-260518-1.1
Date:	May 2026
Distribution:	Registered access — not for onward circulation
Company:	InvestPuppy Pte Ltd

Two people saw the same gap in institutional wealth management from opposite ends of the industry. One spent the better part of three decades inside the portfolio management technology that institutional asset managers use as standard and boutique practitioners have never been able to access. One spent two decades building the infrastructure layer — the cloud-native financial architecture that makes institutional-grade systems possible without legacy infrastructure constraints. *What they built together is the platform that closes the gap they both saw.*

This document provides context on that experience — the domains it covers, the depth it represents, and why it is directly relevant to what InvestPuppy has built. It does not name the founders, the institutions they have worked with, or the platforms they have built on or for. Those details are disclosed in full at NDA stage.

1. The gap we both saw

Boutique discretionary portfolio managers are managing institutional-scale complexity with tools that were not built for them. The systematic portfolio management infrastructure that institutional asset managers use as standard has never been accessible at boutique scale. The terminal costs are prohibitive. The integration complexity assumes a large technology team. The consumer-grade alternatives automate away the judgment that defines boutique wealth management.

This is not a technology gap. **It is an access gap.**

The two founders of InvestPuppy saw this gap from different sides of the same industry — one from the portfolio management and wealth management application layer, one from the core financial technology infrastructure layer. They arrived at the same conclusion independently: the tools that boutique practitioners need have existed for decades at institutional scale. Nobody had built the version that boutique practitioners can actually use.

InvestPuppy was not formed by strangers. The founding team's professional relationship spans approximately a decade, established through shared work in institutional financial technology. Vektor is not the output of a six-month startup sprint. It is the output of a working partnership that long preceded it.

2. Chief Executive Officer

Portfolio management · Wealth management · Institutional deployments

The **CEO** spent the better part of three decades working inside the institutional portfolio management technology that boutique practitioners cannot access — spanning the product's full commercial lifecycle. This was not observational experience. It was operational, at every stage of the implementation lifecycle: vendor, implementation specialist, solution architect, and programme and engagement management for major institutional deployments.

The institutional clients in those engagements included some of the largest wealth management and private banking operations in the world. The CEO's role was to design, architect, and deliver solutions that met the operational, compliance, and performance requirements of Global Tier 1 banks and their wealth management divisions — and to own those client relationships commercially through delivery.

“The Unvarnished series is a partial record of what was seen in those rooms — not as an observer, but as the person responsible for the outcome.”

What this experience provides is not a general familiarity with institutional portfolio management technology. It is a *specific and forensic knowledge* of how these systems work from the inside — their architectural limitations, their implementation failure modes, the commercial structures that make them inaccessible at boutique scale, and the client relationship patterns that determine whether they succeed or fail in deployment.

What this means for Vektor: The platform was not designed by someone who studied the problem from outside. It was designed by someone who spent the better part of three decades inside the systems that boutique practitioners cannot access — managing the engagements, owning the client relationships, and building Vektor specifically to close the gap those systems leave open.

3. Chief Technology Officer

Core banking infrastructure · Cloud-native architecture · Digital banking

The **CTO** spent two decades building the infrastructure layer of institutional financial technology — the systems that financial applications are built on, not the applications themselves. This distinction matters. Most fintech products are built by teams who understand the application layer. The CTO understands both: the infrastructure beneath and the applications above.

The technical architecture work spans cloud-native core banking infrastructure deployed by major financial institutions and the end-to-end architecture of digital challenger bank

launches. These are production-grade financial infrastructure systems operating at institutional scale, built from first principles under the compliance, data governance, and integration security requirements that institutional financial technology demands.

“Institutional-grade financial technology does not happen by accident. Data residency, audit trail, API integration security — these are architectural decisions made at the first line of infrastructure, not features added afterwards.”

The platform was built to operate *within* custodian-connected financial infrastructure, not alongside it. The integration architecture — including the API connectivity model that allows Vektor to sit natively within custodian bank operating environments — reflects two decades of building exactly this kind of infrastructure at institutional scale.

What this means for Vektor: The platform’s technical architecture was designed to meet institutional compliance standards from the ground up — by a CTO who has built institutional-grade financial infrastructure before, under the same frameworks that Vektor’s institutional clients will require. This is not the typical pre-revenue fintech technical risk profile.

4. What the combination represents

The CEO and CTO backgrounds are individually significant. Together they are *precisely complementary* for the specific problem InvestPuppy is solving.

The access gap in boutique wealth management has two components. The first: the portfolio management methodology and workflow used by institutional asset managers has never been built at boutique scale. The second: the technical architecture required to deliver that methodology to compliance, integration, and operational standards has never been accessible without institutional infrastructure beneath it.

The CEO’s experience addresses the first component directly — three decades of building, implementing, managing, and owning the portfolio management application layer for institutional clients who take it for granted. The CTO’s experience addresses the second — two decades of building the infrastructure layer that makes institutional-grade financial technology possible without legacy constraints.

“Between the two founders, the complete institutional financial technology stack — from core banking infrastructure to portfolio management application — is represented from the inside. Vektor is the product of that combined knowledge, built for the practitioners who work within it daily.”

This is not a coincidence of hiring. It is the reason Vektor was built the way it was built: *architecture-first, compliance-by-design, practitioner-workflow at the centre*. The ten Unvarnished papers document the failure modes this platform was specifically designed to avoid. The technical white paper series documents the methodology it was designed to deliver. Both were written by a founding team that has operated inside the systems they describe — together, for approximately a decade, before InvestPuppy existed.

5. What this document does not tell you — and why

“We have not told you everything. That is intentional. And it is honest.”

There are details of the specific platforms, institutions, and projects involved in the founding team’s backgrounds that this document does not disclose. The reasons are straightforward: at this stage of InvestPuppy’s development, the combination of those details would make the founding team identifiable in the market before the company is ready to be identified. This is a deliberate decision, not an evasion.

It is consistent with the same principle that governs the platform: **“Honest by design.”** The document is honest about what it contains. It is equally honest about what it does not contain, and about why. A document that claimed completeness while omitting material information would be a different kind of dishonesty.

The full founding team biographies — including the specific platforms, institutions, and projects referenced here — are disclosed under NDA. If the experience described in this document raises questions that require specific answers before you can assess the proposition, the NDA conversation is the right next step.

Bring your questions — we will answer every one directly. The NDA unlocks the full document suite: nineteen Vektor documents, full founder biographies, and the complete commercial terms. There are no further gates after that.
